Attack 1

Attack 2

Attack 3

Conclusions

traditional systems:

- 1 user identification
- 2 user authentication
- 3 granting rights

security problem:

- identification+authentication **secures proper assignment of rights**
- but... reveals a lot of data that can be used by a malicious parties

too much information is a security threat ^a

^alike writing PIN on an ATM card

Privacy/Personal Data Protection/Anonymity

Attack 1

Attack 2

Attack 3

Conclusions

anonymous credentials idea:

- 1 presenting anonymous credentials
- 2 granting rights

anonymous credential:

- presents chosen attributes of the user
- presents a proof that a trusted party has confirmed these attributes for this user without **revealing identity of the person**

Anonymous Credential System

Revocation
system

U-Prove
Revocation -
FC 2013

U-Prove
Revocation -
MS

Attack 1

Attack 2

Attack 3

Conclusions

Issuing a witness

- user interacts with a Trusted Party who can verify the attributes
- the user gets a **witness** – cryptographic data that is used to create credentials

Presenting credentials

- a user takes the witness, and chooses a subset of attributes
- creates a **credential** on (a formula about) selected attributes

Credentials verification

a verifier takes the credentials and checks that

- the attributes have been confirmed by the Trusted Party
- the formula on the attributes holds

Anonymous Credential System

Attack 1

Attack 2

Attack 3

Conclusions

Products

UProve: Microsoft, based on Brands idea

Idemix: IBM, mainly based on Camenisch, Lysyanskaya techniques

Problems

- relatively “heavy” computations
- hard to understand
- not really suited for smart cards, only some subprocedures in a secure environment of smart cards
- application scope?

many versions of anonymization possible: a similar product is **Restricted Identification** on German personal identity cards

Revocation Scheme

Anonymous
credentials

Revocation
system

U-Prove
Revocation -
FC 2013

U-Prove
Revocation -
MS

Attack 1

Attack 2

Attack 3

Conclusions

Problem

- a user may lose some attributes
- strong anonymity may enable the user to use the outdated credentials – **we have to prevent this, otherwise the system is useless for most practical applications**

Revocation Scheme

extra functionality:

- the user proves that his attributes have not been revoked by the Revocation Authority

Revocation Challenges

al.

Anonymous
credentials

Revocation
system

U-Prove
Revocation -
FC 2013

U-Prove
Revocation -
MS

Attack 1

Attack 2

Attack 3

Conclusions

a user creates a proof that

- 1 the chosen attributes have been confirmed by the Trusted Party
- 2 they have not been inserted into the accumulator (the current accumulator value is used)

The accumulator is computed and published by a Revocation Authority.

Attack 1

Attack 2

Attack 3

Conclusions

Paper:

Acar, T., Chow, S.S.M., Nguyen, L.: Accumulators and U-Prove Revocation. Financial Cryptography. LNCS 7859 (2013)

Strategy

- on-top of Uprove as a “plug-in”
- it uses accumulator concept
- it reuses the standard mechanisms of anonymous credentials schemes

Problems

- 1 bilinear mappings used, but standard embedded devices do not support bilinear groups
- 2 complicated
- 3 no formal proof – flaws might exist^a

^alike the one indicated by our FC 2014 paper (already corrected by the authors)

UProve Revocation -Microsoft

credentials

Revocation
system

U-Prove
Revocation -
FC 2013

U-Prove
Revocation -
MS

Attack 1

Attack 2

Attack 3

Conclusions

problems with verification of $Y = X^\delta$

- δ is known neither to the prover nor to the verifier so it cannot be checked directly
- $K = g^\delta$ as well, so if there is a workaround, then we can solve the equality of discrete logarithms problem.
- for bilinear groups it would be easy

Solution

the equality $Y = X^\delta$ is checked by the Revocation Authority holding the key δ .

Disadvantages

- the system is not distributed one anymore
- RA gets traffic data
- potentially RA may recognize each single user while the primary goal was to hide the identity of the user

Attack 1

Attack 2

Attack 3

Conclusions

Input:

RA private key:	$\delta \in \mathbb{Z}_q$
Revocation parameter:	g_t
List of revoked attribute values:	R
New user's revocation attribute:	$x_{id} \notin R$
Current accumulator:	V
Auxiliary database:	\mathcal{T}

Computation:

1. compute d and W via `ComputeWitness` for R and x_{id}
2. choose u at random
3. $\underline{d} := d + u \pmod q$
4. $\underline{Q} := VW^{-x_{id}} g_t^{-\underline{d}}$

Output:

insert (g_t^u, x_{id}) in the database \mathcal{T}
give $(\underline{d}, W, \underline{Q})$ to the user holding x_{id}

Anonymous
credentials

Revocation
system

U-Prove
Revocation -
FC 2013

U-Prove
Revocation -
MS

Attack 1

Attack 2

Attack 3

Conclusions

Revocation Authority gets X , Y for which:

$$X^\delta = W^\delta g^{t_1 \delta} = QK^{t_1} = \underline{Q}g_t^u K^{t_1} = Yg_t^u \neq Y .$$

Revocation Authority searches for an entry (Z, x_{id}) such that $X^\delta = YZ$.

- If there is one, then the answer is `correct` and as a side effect the Revocation Authority learns x_{id} .
- Otherwise, the answer is `false`.

Attack 1

Attack 2

Attack 3

Conclusions

how to compute (Q_1, W_1, d_1) from (manipulated) (Q, W, d) ?

- According to `UpdateWitness` \underline{d}_1 , the new value of the parameter d , equals

$$\underline{d}_1 = \underline{d}(x' - x_{id}) = (d + u)(x' - x_{id}) = d_1 + u(x' - x_{id})$$

where $d_1 = d(x' - x_{id})$ is the correct value for the correct initial witness.

- W will updated correctly since no manipulated value is applied for the update.
- The new value of Q equals

$$\underline{Q}_1 = VW^{-x_{id}} g_t^{-\underline{d}_1} = VW^{-x_{id}} g_t^{-d_1 - u(x' - x_{id})} = Q_1 g_t^{-u(x' - x_{id})},$$

where Q_1 is the value of Q computed for the correct d_1 .

If the verifier presents a pair (X, Y) created by the user holding x_{id} , then

$$X^\delta = W_1^\delta g_t^{t_1 \delta} = Q_1 K^{t_1} = \underline{Q}_1 g_t^{u(x' - x_{id})} K^{t_1} = Y g_t^{u(x' - x_{id})}.$$

Attack 1

Attack 2

Attack 3

Conclusions

learn the IDs of all revoked users

... and compute the witness yourself

the MS technical draft suggests that the revocation attributes of the revoked users can be hidden:

If the revocation list is secret, or for better efficiency, the witnesses are computed by the Revocation Authority . . .

Moreover, initially the set of revoked users may be large and complicated (artificial users due to system testing and initialization).

Solution

see IACR eprint 108/2015: idea+implementation

Attack 1

Attack 2

Attack 3

Conclusions

Main properties

- compute the witnesses according to the specification
- .. but manipulate K : now $K = g^{\tilde{\delta}}$ where $\tilde{\delta} \neq \delta$
 - but still use δ for accumulator, witnesses, ...
 - recognizing that $K \neq g^{\delta}$ would require solving DDH Problem
- there are many elements depending on δ that potentially could disclose a deviation from the protocol - nevertheless the users cannot see any difference

Attack 2

Attack 3

Conclusions

Manipulations on V

- use $\delta := (\alpha_1 + \alpha_2) \cdot 2^{-1} \bmod q$
- For $i = 0, 1, 2, \dots$ let:

$$\Lambda_i := g_t^{(\alpha_1 + \alpha_2) \cdot 2^{-1} \bmod q} \quad \text{and} \quad \Delta_i := g_t^{\delta^i}.$$

- the regular computation:

$$V = \prod_{i=0}^m (\Delta_i)^{a_i}$$

where

$$\prod_{i=1}^m (\delta + x_i) = \sum_{i=0}^m a_i \cdot \delta^i$$

- attack: take

$$V = \prod_{i=0}^m (\Lambda_i)^{a_i}$$

Attack 1

Attack 2

Attack 3

Conclusions

Lesson learnt

- the procedures must be fully specified – under-specification enables creating malicious systems with **insecurity-by-design**
- serious problems with UProve Revocation system as specified by MS
 - ⇒ many patches necessary, no efficient patch for the last attack in case of a large scale system
 - ⇒ the system more and more complicated
 - ⇒ a complicated system is more vulnerable as it is easier to overlook attack scenarios,
 - ⇒ no serious analysis as it is costly, time-consuming, boring, unattractive for academia, less effective than marketing propaganda ...
- maybe UProve revocation should **backtrack to FC'2013** solution by Acar, Chow, Nguyen (with bilinear mappings)
