Legal Framework

signature
creation data
(**secret key**)

signature
verification data
(**public key**)

Qualified Certificate

- 1 certificate issuer
- 2 date of issue and expiration
- 3 ID of the certificate holder:
 - family name: Kutylowski
 - given name: Mirosław
 - personal number (PESEL):
...
- 4 2048 RSA public key:
0x00308187028181 ...
- 5 signature of the issuer
:

Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

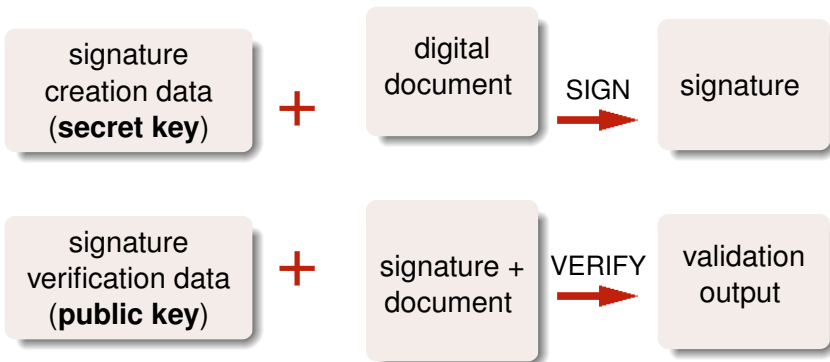

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

1 Verification of the signature
(using the public key from the certificate)

2 Verification of the identity of the key holder
– checking the certificate

Checking the Signature

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

1 Verification of the signature
(using the public key from the certificate)

2 Verification of the identity of the key holder
– checking the certificate

Cryptographic Point of View

If signature verifies correctly then:

- it was created with the proper signing key, or
- the signing scheme has been broken

Checking the Signature

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

1 Verification of the signature

(using the public key from the certificate)

2 Verification of the identity of the key holder

– checking the certificate

- **problem:** the signing key can be: stolen (with a smart card), retained by the certification provider, leaked (trapdoor), smart card can be misused, ...

Cryptographic Point of View

If signature verifies correctly then:

- it was created with the proper signing key, or
- the signing scheme has been broken

Additional Mechanisms

Each certificate:

- has limited validity period
- can be revoked by issuer / signer

Standard Implementation – Properties

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

**Standard
Implementation**

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

A secret (signing) key :

- stored on a cryptographic smart card
- access secured with a PIN number

Status of the certificate can be checked with :

- OCSP (Online Certificate Status Protocol)
- recent CRL (Certificate Revocation List) – risky for the verifier

Standard Implementation – Properties

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

**Standard
Implementation**

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

Key idea :

- enable signing offline

Reality :

- verification must be performed online
- signing time unknown

Risk Issues

M. Kutylowski

Advanced Digital Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

1 loosing control over a signature creation device

Mediated Signature Architecture

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

Background

- 1 there are at least two parties of the protocol:
 - user
 - security mediator
- 2 creation of a single signature is possible if **all** the necessary parties are involved (by using the appropriate cryptographic material)

Mediated Signature Architecture

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures
Validity of the
Signature
Standard
Implementation
Risk Issues
Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario
Legal Framework

User

(1) creates a pre-signature S_1 , using his private key K_1 :

$$S_1 = \text{SIG}(K_1, \text{Hash}(M))$$

S_1

S

Mediator

(2) finalizes the signature, using the appropriate keying material K_2 :

$$S = \text{FIN}(K_2, S_1)$$

Mediated Signature Architecture

User

(1) creates a pre-signature S_1 , using his private key K_1 :

$$S_1 = \text{SIG}(K_1, \text{Hash}(M))$$

S_1

S

Mediator

(2) finalizes the signature, using the appropriate keying material K_2 :

$$S = \text{FIN}(K_2, S_1)$$

- there is **one** public key K related to the secret key pair (K_1, K_2)
- S is the signature of M

RSA Based Mediated Signature

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

Keys

- $n = pq, d \cdot e = 1 \bmod \varphi(n)$
- splitting the key d :
 - for mediator: $d_1 := \text{HSM}(K, ID_{\text{signer}})$
 - for the signer: $d_2 := d - d_1$

RSA Based Mediated Signature

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

Keys

- $n = pq, d \cdot e = 1 \pmod{\varphi(n)}$
- splitting the key d :
 - for mediator: $d_1 := \text{HSM}(K, ID_{\text{signer}})$
 - for the signer: $d_2 := d - d_1$

Signature Creation

signer: $s_1 := (\text{hash+padding}(M))^{d_1}$

mediator: $s_2 := (\text{hash+padding}(M))^{d_2}$

signature: $s := s_1 \cdot s_2 \pmod{n}$

Signature Verification

as usual

RSA Based Mediated Signature

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

Extended Scenario

- one key on a smart card
- the second key on the laptop
- the third key on a server

Attack

creating a signature by the adversary requires

- stealing the smart card, and
- stealing the laptop, and
- breaking into the server

RSA Based Mediated Signature

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

Extended Scenario

- one key on a smart card
- the second key on the laptop
- the third key on a server

Attack

creating a signature by the adversary requires

- stealing the smart card, and
- stealing the laptop, and
- breaking into the server

For Paranoids

split the key into even more pieces and put them on independent devices

Main Features

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

Revocation

The signer can block signing possibility for any time, any reason, ... :

- block the card used in his office for vacation time and holidays
- block the card during a stay in a hospital
- block the card for the time 23:00-6:00 every day
- ...

in this case the signature **WILL NOT BE CREATED**

Monitoring

Mediator can monitor the signing activities and refuse to finalize if something suspicious is going on

Main Features II

M. Kutylowski

Advanced
Digital
Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated
Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

Signing Time

Mediator can implement hash chaining and provide undeniable and verifiable evidence of the signing time

Verification

- no adjusting the software necessary - no special time stamps, ... that need to be interpreted well
- in fact, Mediator performs pre-validation of a signature, making it easier for the recipient of the document

Risks

- we do not depend solely on security of smart cards!
- two weaker but independent mechanisms are better than a single strong one

Public Administration Case Study

M. Kutylowski

Advanced Digital Signatures

Qualified Signatures
Validity of the
Signature
Standard
Implementation
Risk Issues
Reasons of Failure

Mediated Signatures

Cryptographic
Description
Mediated RSA
Example
Application Scenario
Legal Framework

Signing documents exchanged between citizens and public authorities:

- single point of contact as a favorable solution: it can be integrated with Mediator
- privacy: the public bodies know anyway these documents
- signature can be created by ID cards even if thousands of them are stolen or lost (security does not depend solely on ID cards) the smart cards do not require the best possible protection and can serve for a longer time
- automatic and provable date of signing - elimination of frauds and legal disputes

Use in Corporations

M. Kutylowski

Advanced Digital Signatures

Qualified Signatures

Validity of the
Signature

Standard
Implementation

Risk Issues

Reasons of Failure

Mediated Signatures

Cryptographic
Description

Mediated RSA
Example

Application Scenario

Legal Framework

- full control over signing activities, disabling a single user immediate
- excellent tool for controlling document flow in a heterogeneous IT environment

Compatibility with EU Directive

M. Kutylowski
