Aggregation

Building blocks
Construction
Analysis

RBF - Robust Bloom Filter

- Result - representation of a subset of elements collected by “green“ stations delivered to the sink.
- Legitimate stations can add any element.
- Extraneous nodes cannot manipulate the representation. Every manipulation is **detected** with high probability.
- Protocol supports **idempotence** and **commutativity**.
⇒ no synchronization is needed, multi-route processing is possible.
- Only the sink can learn (even the partial) the result.

Our protocols

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks
Construction
Analysis

RCC - Robust Cryptographic Counter

- Better size/security trade-off
- "Aggregation" limited to some functions (sum, maximum ...)
- Protocol supports **commutativity** but not **idepotence**.

Bloom Filter - I

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks
Construction
Analysis

- BF is a probabilistic data structure used for representing collection of items.

Bloom Filter - I

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks
Construction
Analysis

- BF is a probabilistic data structure used for representing collection of items.
- We can check if a given element is in the set represented by BF
 - if is, the answer is always TRUE.
 - FALSE positive is possible with some small, **controllable** probability.

Bloom Filter - II

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks
Construction
Analysis

Construction

- depends on two parameters n, l
- a table of n bits; at the beginning all are 0.
- l hash functions $H_1, H_2, \dots, H_l : \{0, 1\}^* \rightarrow \{1, \dots, n\}$

Bloom Filter - II

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks
Construction
Analysis

Construction

- depends on two parameters n, l
- a table of n bits; at the beginning all are 0.
- l hash functions $H_1, H_2, \dots, H_l : \{0, 1\}^* \rightarrow \{1, \dots, n\}$

Adding element x to BF

- 1 We compute $\{H_i(x)\}_{i=1}^l$
- 2 $H_i(x)$ -th bit of the table is set to 1 for all $1 \leq i \leq l$.

Aggregation

Building blocks
Construction
Analysis

Toy Example $n = 9, l = 3$

- Current state of BF is 0 1 1 0 0 1 0 0 1
- Adding x . We compute $H_1(x) = 8, H_2(x) = 6, H_3(x) = 1$.
- After that BF is 1 1 1 0 0 1 0 1 1.

Is element x' in BF ?

- We compute $H_1(x) = 1, H_2(x) = 7, H_3(x) = 2$ and check if **all** that bits are set to 1.
- 1 1 1 0 0 1 0 1 1

Bound for false positive error

$$< \left(1 - \exp \left(\frac{-l(n + 0.5)}{k - 1} \right) \right)^l .$$

Homomorphic Encryption

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks
Construction
Analysis

Idea

- $E(m_1) \odot E(m_2) = E(m_1 + m_2),$

Homomorphic Encryption

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks
Construction
Analysis

Idea

- $E(m_1) \odot E(m_2) = E(m_1 + m_2)$,
- Re-encryption without **public** key has to be feasible - every party can re-encrypt a given ciphertext.
- Without the **private** key one cannot distinguish $E(0)$ and $E(1)$.

Homomorphic Encryption

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks
Construction
Analysis

Idea

- $E(m_1) \odot E(m_2) = E(m_1 + m_2)$,
- Re-encryption without **public** key has to be feasible - every party can re-encrypt a given ciphertext.
- Without the **private** key one cannot distinguish $E(0)$ and $E(1)$.
- ElGamal (some other as well).

RBF - Robust Bloom Filter

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks

Construction

Analysis

Idea - I

- aggregated data represented as BF of length n

RBF - Robust Bloom Filter

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks

Construction

Analysis

Idea - I

- aggregated data represented as BF of length n
- trick one - every single bit of BF is represented by a ciphertext of 0 or 1 (homomorphic encryption), called **block**.

RBF - Robust Bloom Filter

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks

Construction

Analysis

Idea - I

- aggregated data represented as BF of length n
- trick one - every single bit of BF is represented by a ciphertext of 0 or 1 (homomorphic encryption), called **block**.
- trick two - we add a m “dummy blocks”- ciphertexts of a fixed value ζ .
They are randomly permuted with regular blocks.
Adversary cannot distinguish them. If the dummy block is changed - the sink can detect it.
⇒ The final result is considered **corrupted**.

RBF - Robust Bloom Filter

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks

Construction

Analysis

Idea - II

- Only stations from the subset knows positions of dummy blocks.
- Such construction (collection of blocks) is traversing the network and **all** blocks are recoded after visiting any “green” station. Moreover the station can add its element to BF (homomorphic property).

RBF - Robust Bloom Filter

Robust Data
Aggregation

Klonowski,
Koza,
Kutyłowski

Problem
Statement

Robust
Aggregation

Building blocks

Construction

Analysis

Idea - II

- Only stations from the subset knows positions of dummy blocks.
- Such construction (collection of blocks) is traversing the network and **all** blocks are recoded after visiting any “green” station. Moreover the station can add its element to BF (homomorphic property).
- All blocks are delivered to the sink and decoded.
- Very wide class of routing strategies is possible (exact topology of the network may be unknown).
